

Setup Instructions

1. Prerequisites

Make sure you have installed:

- Node.js 18+
- npm
- Git

Check your versions:

```
node --version  
npm --version  
git --version
```

2. Clone the Repository

```
git clone https://github.com/YOUR_USERNAME/followup-ai.git  
cd followup-ai
```

3. Install Dependencies

```
npm install
```

4. Start the Development Server

```
npm run dev
```

Open the URL shown in the terminal, usually:

```
http://localhost:5173
```

5. Build for Production

```
npm run build
```

Preview the production build:

```
npm run preview
```

6. Project Configuration

The prototype uses demo patient data and browser-based persistence.

Risk calculation is handled by the scoring engine:

```

Patient Data
  ↓
Risk Engine
  ↓
Risk Score (0–100)
  ↓
Risk Category
  ↓
Factor Explanations
  ↓
Recommended Action
```

Default risk weights:

Missed Appointments	40%
Attendance History	15%
Distance	15%
Treatment Duration	10%
Appointment Frequency	10%
Age	10%

7. Demo Data

The application includes fictional patient records for demonstration.

No real patient information should be used in the demo environment.

8. Using the Application

1. Open the Dashboard.
2. Review high-risk patients.
3. Open the Priority Queue.

4. Select a patient.
5. Review the risk score and contributing factors.
6. Choose an intervention such as SMS, reminder, call, or rescheduling.
7. Record the intervention status.
8. Use Analytics to review overall trends.
9. Use Risk Simulator to test how changing patient factors affects the score.

9. Production Deployment

Before real-world deployment, replace demo LocalStorage with a secure backend/database and implement:

- Authentication and role-based access
- Encryption
- Audit logging
- Secure patient-data handling
- EHR/EMR integration
- Model validation and monitoring
- Privacy and regulatory compliance

⚠ FollowUp AI is a prototype and should not be used for real clinical decision-making without appropriate validation, security, governance, and professional oversight.
